(54) Title: SERVICE SHUT OFF DEVICE

(57) Abstract

A service shut off device which is a selected length of a composite body adapted to be formed into a shape to fit in use around a service line. The composite body has a flexible casing (20) and a body of intumescent material (28) received in the casing. The body of intumescent material (28) may be continuous. The composite body has means (32) associated with the casing to contain the intumescent material within the casing and means (36) to retain the collar in a selected shape around the service line. Mounting brackets (36) can clip onto the body or be part of the body.

SERVICE SHUT OFF DEVICE

FIELD OF INVENTION

5 This invention relates to service shut off devices and more particularly to articles known as fire collars.

BACKGROUND

Service shut off devices or fire collars are placed around service lines such as plastics materials pipes or cable trays where they pass through a wall or soffit so that in the event of a fire intumescent material within the service shut off devices or
10 fire collars will expand and close off the hole through the wall or soffit to prevent the fire passing from one part of a building to another.

Service shut off devices or fire collars are generally made for a single size of pipe or cable tray or other service line and therefore where a major installation is occurring and there may be a number of different sizes and shapes of plastic pipes, cable
15 trays or other service lines then a large stock of service shut off devices or fire collars is necessary.

It is the object of this invention to provide a service shut off device or fire collar arrangement where a large range of different size and shape stocks is not necessary.

20 BRIEF DESCRIPTION OF THE INVENTION

In one form, therefore, the invention is said to reside in a service shut off device comprising a selected length of a composite body adapted to be formed into a shape to fit in use around a service line, the composite body having a flexible casing and a body of intumescent material received in the casing, the composite
25 body further comprising means associated with the casing to contain the intumescent material within the casing and means to retain the collar in a selected shape around the service line.

Preferably the body of intumescent material is continuous. The body of intumescent material may be transversely cut or perforated at intervals to assist

with selection of the required length of the service shut off device.

It will be seen that by this means a selected length of a strip of service shut off device or fire collar material can be wrapped around a cable tray, service line or a pipe or formed into selected shape to be placed around a cable tray, service line
5 or a pipe and retained in that shape.

In one preferred embodiment of the invention the flexible casing may be substantially U-shaped with the intumescent material received in the hollow of the U-shape.

Alternatively the casing may only provide a backing for the intumescent material or
10 may provide a backing and one edge.

Preferably the casing may be made from a metallic material such as sheet aluminium, stainless steel or steel and may be anodised or galvanised to prevent corrosion in an installation. The casing may comprise a perforated metal sheeting which is flexible enough to be bent into the required shape.

15 Alternatively the casing may be manufactured from a composite material such as a glass reinforced material or the like.

The flexibility of the casing may be provided by a plurality of transverse lines of weakening in the casing and the intumescent material being sufficiently flexible to be able to be bent around the service line or pipe or containing areas of
20 weakening to enable it to be bent into a selected shape such as a circular shape.

The means to retain the collar in the selected shape such as a circular shape may be a wire or other strap material which can be wound around the collar when it is formed into the selected shape and joined to hold the collar in that shape.
Alternatively fasteners such as screws or blind rivets may be used to hold the
25 device in the selected shape.

In one embodiment the service shut off device or fire collar may be adapted to be formed around a service line within a wall or soffit or alternatively the service shut off device or fire collar may be mounted against a wall or soffit.

There may be provided brackets either associated with the casing or a separate bracket which can be fastened onto the casing to hold the casing against a wall or soffit.

There may be tabs extending from the casing which may provide the brackets.

- 5 There may be a plurality of co-acting connecting pieces on the bracket and the casing so that the racket is retained onto the casing.

- 10 The co-acting connecting piece between the casing and the bracket may also act to be a connector between the ends of the casing of the composite body to both retain the casing in the selected shape and to be used as a bracket. Hence the bracket both holds the selected shape of the fire collar and acts as a mounting bracket.

The means associated with the casing to contain the intumescent material within the casing may be an adhesive. Alternatively it may include a plurality of tabs associated with the casing which extend against or into the intumescent material.

- 15 The means to retain the collar in the selected shape may include a link member, the link member having a plurality of pins adapted to co-act with apertures on the casing across a join in the casing whereby the collar is retained in the selected shape.

- 20 The service shut off device may include a plurality of co-acting connecting pieces on the bracket and the casing so that the bracket is retained onto the casing.

The service shut off device may be provided by a stack of more than one service shut off device as discussed above.

- 25 In an alternative form the invention is said to reside in a continuous strip fire collar material including a casing and a continuous flexible intumescent material within the casing, the strip comprising the casing and intumescent material adapted to be severed at selected intervals along the length of the continuous strip such that the strip can be cut off at the selected length and the severed portion wrapped around a service line such as a pipe or cable tray to provide a fire collar.

The casing may be sufficiently flexible to enable it to be formed into the selected shape or the casing may be provided with transverse lines of weakening at intervals along its length so that it may be wrapped into a selected shape of a fire collar.

- 5 The transverse points of weakening may be done by a plurality of perforations transverse to the length of the strip, or alternatively may be done by thinning of the material in transverse lines across the strip material.

- 10 Such transverse lines of weakening may also provide the regions at which the strip of material can be severed to form the individual lengths for the fire collar and also enable it to be bent around or wrapped around to form a selected shape for the fire collar.

The casing may include lugs formed or bent out of the plane of the casing to extend onto or into the intumescent material within the casing to retain the intumescent material in the casing.

- 15 The casing may also include tabs extending from the casing which may be bent out to provide brackets to mount the service shut off device to a wall or soffit.

- 20 In one preferred embodiment the casing may be comprised of a face section and two side sections adapted in use to provide a substantially U-shaped body. The lugs bent out of the casing may be on the face of the casing or on one of the side sections.

Alternatively the casing may only provide a backing for the intumescent material or may provide a backing and one edge.

- 25 Preferably the side sections are formed from a plurality of tabs configured such that upon bending of the continuous strip into a selected shape such as a circular shape the tabs enable the inner side of the strip to form a smaller radius than the outer side. The tabs may overlap or pass under adjacent tabs to enable the bending. One method by which this can be done is to provide two bend lines between the face section and each side section with the lines separated by essentially the thickness of the casing material. Alternate tabs may be bent on one line and the in
30 between tabs bent on the other line. Alternatively a bend line for each tab may be

angled to the direction of elongation of the strip so that during bending a tab passes under the adjacent tab on one side and over the adjacent tab on its other side.

- 5 There may be further provided from one or both of the side sections tongues extending from the side sections and which are folded over the intumescent material such that they are substantially parallel to the face. One tongue may extend from each tab on each side. Such tongues may assist in retaining the intumescent material within the casing and to assist with crushing of a pipe when the intumescent material is expanding in use or to assist with transfer of heat to the
- 10 pipe so that it assists with softening of the pipe.

There may be further provided brackets to mount the fire collar to a wall or ceiling or soffit in use.

The brackets may be adapted to clip onto the casing so that they are attained with the casing.

- 15 In one preferred embodiment of the invention there may be provided a plurality of co-acting connecting portions on the brackets and collar so that the bracket can be retained onto the collar. In one form the co-acting connecting arrangement may be a plurality of slots formed in the casing with a plurality of pins on the brackets. Alternatively the pins may be provided on the casing and the slots on the
- 20 brackets.

There may be further provided means to retain the continuous strip of material into a selected shape such as a circular shape. Such a means may be comprised of wire or other strip material adapted to be wrapped around the casing and joined together to form the selected shape of the fire collar.

- 25 Alternatively the joining of the continuous strip into the selected shape may be done by the brackets being mounted by the co-acting connecting portions on both ends of the strip when wrapped in the selected shape so that the bracket acts as both the mounting bracket and retainer for the selected shape. In such an embodiment the bracket may include at least two pairs of co-acting connecting
- 30 catch means so that the casing can be gripped across the joint.

The intumescent material may be retained onto the casing by an adhesive.

It will be seen that generally from this invention by having a continuous strip of fire collar material the strip can be broken off or severed in a selected length and then wrapped around a service line such as a cable tray or pipe. Hence a tradesman
5 need only carry a continuous length of the material onto site and the material cut off to length as required.

The continuous strip of the present invention may be transported in a packaging system for a continuous strip material type of the type discussed above which is adapted to be used in a selected length, the packaging comprising a cuboidal
10 body adapted to contain a roll of the continuous strip material, the cuboidal body having two opposed sides and two pairs of opposed edges, a slot in a first edge of the cuboidal body through which the material may be drawn and markings on the packaging on or adjacent the first edge to enable measurement of the selected length.

15 It will be seen that by use of such a packaging system a continuous strip such as the continuous strip of fire collar material may be stored within the packaging and the strip drawn out just to the length required then the strip broken off or severed off by other means to give the strip of material which can be formed into the fire collar.

20 The packaging system may also include a drawer or other receptacle within the body which can hold the brackets or other means for retaining the fire collar into a circular shape.

The packaging system may also have an axis formed into it from one face to the other so the roll of strip material is supported while it is being unwound or
25 alternatively shaping of packing within the packaging may assist to retain the roll of strip material in a substantially wound form.

There may be slot in one of the faces so that a user may view the strip within the casing to see what length of the strip is still remaining.

30 In a further form the invention may be said to reside in an intumescent material for a service shut off device, the intumescent material including a plurality of voids such

that a strip of the material can be formed into substantially circular shape with the material being compressed and absorbing the compression by means of the voids to allow for an inner circumference which is smaller than an outer circumference.

- 5 Preferably the intumescent material has a backing material which is a non woven fibrous material and the non woven fibrous material is severed transversely at intervals to provide lines of weakening for cutting of the strip to a required length.

In a further form the invention may be said to reside in a service shut off device comprising a stack of two or more fire collars.

- 10 By this arrangement there can be obtained a faster shut off or a more powerful shut off of a service line such as a pipe.

This then generally describes the invention but to assist with understanding, reference will now be made to the accompanying drawings which show a preferred embodiment of the invention.

15 BRIEF DESCRIPTION OF THE DRAWINGS

In the drawings:

Figure 1 shows a packaging arrangement for a continuous strip of fire collar material,

- 20 Figure 2 shows a fire collar formed into a circular shape using the continuous strip of the present invention,

Figure 3 shows a preferred embodiment of a strip of casing material according to one embodiment of the invention,

Figure 4 shows a portion of a continuous strip of fire collar material,

Figure 5 shows the other side of the continuous strip shown in Figure 4,

- 25 Figure 6 shows one view of a bracket for a collar according to this invention,

Figure 7 shows a further view of the bracket shown in Figure 6,

Figure 8 shows an embodiment of fire collar according to this invention utilising two fire collars for larger diameter pipes,

5 Figure 9 shows a similar embodiment as that in Figure 8 utilising two fire collars for larger diameter pipes but with a different method of retaining the collars,

Figure 10 shows a similar embodiment as that in Figure 8 utilising two fire collars for larger diameter pipes but with a different method of retaining the collars,

10 Figure 11 shows a further embodiment of a service shut off device suitable for cable trays,

Figure 12 shows a still further embodiment of a service shut off device suitable for cable trays,

15 Figure 13 shows a further embodiment of continuous strip adapted to form a service shut off device such as a fire collar for smaller diameter pipes,

Figure 14 shows a service shut off device such as a fire collar for smaller diameter pipes formed from the strip of Figure 13,

Figure 15 shows a stacked arrangement of two service shut off devices of Figure 14,

20 Figure 16 shows an alternative embodiment of a service shut off device according to the present invention,

FIG 17 shows an embodiment of a bracket suitable for use with the fire collar shown in Figure 16,

25 FIG 18 shows an alternative embodiment of bracket suitable for use with the fire collar shown in Figure 16,

FIG 19 shows an alternative embodiment of fire collar according to the present invention,

FIG 20 shows a bracket suitable for the fire collar of Figure 19,

FIG 21 shows an alternative view of the bracket shown in Figure 20,

5 FIG 22 shows a portion of a continuous strip of fire collar material suitable for forming the fire collar shown in Figure 16, and

FIG 23 shows an alternative embodiment of the continuous strip service shut off device material suitable to manufacture the fire collar shown in Figure 19.

10 DETAILED DESCRIPTION

A service shut off device comprising a selected length of a composite body adapted to be formed into a shape to fit in use around a service line, the composite body having a flexible casing and a continuous body of intumescent material received in the casing, the composite body further comprising means
15 associated with the casing to contain the intumescent material within the casing and means to retain the collar in a selected shape around the service line.

A service shut off device comprising a selected length of a composite body adapted to be formed into a shape to fit in use around a service line, the composite body having a flexible casing and a continuous body of intumescent
20 material received in the casing, the composite body further comprising means associated with the casing to contain the intumescent material within the casing and means to retain the collar in a selected shape around the service line.

A service shut off device comprising a selected length of a composite body adapted to be formed into a shape to fit in use around a service line, the
25 composite body having a flexible casing and a continuous body of intumescent material received in the casing, the composite body further comprising means associated with the casing to contain the intumescent material within the casing and means to retain the collar in a selected shape around the service line.

Now looking at the drawings in more detail, it will be seen in Figure 1 that the packaging for a continuous strip of fire collar material comprises a generally cuboidal box which may be preferably made out of cardboard which has a face 1 and edges 2, 3, 4 and 5. Within the box there is a spiral coil of intumescent fire collar material which has an end 6 extending out of a slot 7 in the face 5. Markings 8 on the face 1 adjacent the edge 5 show the length of material drawn out of the slot so that a cutting point is known.

A slot 10 in the face 1 enables a user to see the strip material within the casing so that the amount remaining can be checked.

10 A drawer 11 is provided in the face 2. The drawer can retain brackets and mounting nails, screws or bolts for the fire collar. The drawer may be positioned with its opening upwards or to one side depending upon the intended orientation of the packaging in use.

15 Figures 2 to 5 show an embodiment of a continuous strip of material and a fire collar made from the strip according to this invention.

The fire collar in use generally comprises an elongated strip of material formed into a circular shape and retained in that shape.

20 The fire collar comprises a casing 20 which in its unformed shape can be seen in Figure 3. As can be seen in particularly Figures 4 and 5 the casing is of a substantially U-shape having a face 21 and two edges 22 and 24. The edges are cut at intervals as can best be seen in Figure 3 so that the collar can be rolled into a circular shape. Tabs 26 extend from each portion of the segmented edges which in use fold over the intumescent material 28 within the casing 20.

25 In the segmented edge 22 there are formed on alternative segments apertures 30 and pairs of U-shaped lugs 32.

The U-shaped lugs 32 are folded inwards to cut into the intumescent material to retain it in place within casing.

In use the edge 22 is mounted against a wall or socket and the apertures 30 and apertures formed by the lugs 32 being bent inwards allow a certain amount of

intumescent material to flow against the wall or socket to provide a seal at the base of the collar.

On the outer side of the casing 20 are two lines of slots 34 these slots co-act with pins on brackets 36 to hold the brackets to the casing and to join the strip of collar material into a circular shape.

As can be best seen in the strip blank shown in FIG 3 there are two lines of bend lines on each side of the strip. A first line of bend lines 31 is used for the tabs 33 and a second set of lines 29 is used for the tabs 35. By this arrangement after the formation of the continuous strip then during the bending of the strip into the circular shape of whatever diameter the ends of the tabs 35 with the wider portion away from the face 21 will be lower than the tabs 33 and pass under the tabs 33.

The brackets can be seen in more detail in Figures 6 and 7.

On each bracket there is a portion 40 including an aperture 42 so that the bracket be mounted to a wall or socket and an upstanding body part 44 and an upper tongue 46. Pins 48 are bent out of the upstanding portion 44 and bend inwardly and in use are received in the slots 34 in the casing to mount the bracket to the casing.

As discussed earlier the pins 48 may also act to hold the collar into the circular shape by being received in slots 34 on either side of a join.

Pairs of slots may be provided on each segment of the casing so that differences in required diameter can be taken up.

Lines of transverse weakening 25 may be provided at intervals along the length of the casing so that casing may be cut or otherwise severed such as by breaking at the selected points.

Also lines of weakening 27 may be provided within the intumescent material to enable it to be broken off at the selected length.

Figure 8 shows an embodiment of fire collar according to this invention which utilises two continuous strips according to this invention and formed into circular portions to

go around pipes of a larger diameter. Pipe 50 may be of a diameter greater than 100 mm and has a first strip 52 and a second strip 54 wound around it and stacked one on top the other. Double length brackets 56 with retaining pins 58 which extend into recesses 60 in both collars may be provided to ensure that the fire collar is retained in position. Alternatively there may be pins 58 only in the upper portion of the bracket that extend into the upper collar 54 so that only the upper collar is specifically retained.

Figure 9 shows a similar embodiment to that shown in Figure 8 but in this case the mounting of the second collar is different. In this embodiment the first collar 54 is formed into the selected shape and the brackets 56 used to hold the collar in that shape. A second collar 61 is then formed and held in its shape by the brackets 62 which have retaining pins 64 in a similar manner to the bracket 56. The bracket 62 has an extension 66 which passes over the bracket 56 and is fastened to the bracket 56 by a fastener such as a blind rivet 68.

Figure 10 shows a similar embodiment to that shown in Figure 8 but in this case the mounting of the second collar is again different. In this embodiment the first collar 54 is formed into the selected shape and the brackets 56 used to hold the collar in that shape. A second collar 61 is then formed and held in its shape by the brackets 70 which have retaining pins 72 in a similar manner to the bracket 56. The bracket 70 has an extension 74 which also has retaining pins 76 and the extension 74 of the bracket 70 passes over the first collar 54 not in the region of the bracket 56 so that its pins 76 can be received in the recesses 60 to hold the two collars together.

It may be noted that the invention is not restricted to the use of one fire collar or two stacked together but also includes multiple stacking of service shut off devices.

Figure 11 shows a cable tray 80 passing through a wall 81. Above and below the cable tray are strips of service shut off device according to this invention 82 and 84 which are held together by brackets 86 at each end.

Figure 12 shows a cable tray 90 passing through a wall 91. In this embodiment a service shut off device according to this invention 92 has been formed into an oblong shape with rounded ends around the cable tray 90. Brackets 93 are used to hold the service shut off device 92 against the wall 91.

Figure 13 shows a further embodiment of continuous strip adapted to form a service shut off device such as a fire collar for smaller diameter pipes.

5 The continuous strip 100 is formed from a strip of perforated metal 101 with a strip of intumescent material 102 attached to one side by an adhesive. The strip 101 has tabs 103 extending laterally at intervals. In use the strip can be cut off at a selected length and the intumescent material 102 cut back to allow the metal strip to overlap so that it can be fastened in a selected shape such as circular as shown in Figure 14 by the use of fasteners 105 such as blind rivets or screws.

10 Once the service shut off device has been formed in to the selected shape the tabs 103 may be bent out to form brackets 104 to enable the service shut off device to be mounted around a pipe and to a surface.

15 Where a faster shut off or a more powerful shut off of a service line is required two of the service shut off devices as shown in Figure 14 may be stacked together as shown in Figure 15. In this embodiment the tabs 103 on the upper service shut off device 107 have been bent down to enable the upper service shut off device 107 to be fastened to the lower service shut off device 108 by the use of fasteners 109 such as blind rivets or screws. The tabs 103 on the lower service shut off device 108 have been bent out to form brackets 104 to enable the stacked service shut off device to be mounted to a surface.

20 Figure 16, 17, 19 and 22 show an alternative embodiment of continuous strip surface shut off device according to this invention, a service shut off device from using the continuous strip and a bracket suitable for holding the service shut off device. The continuous strip comprises intumescent material 120 fastened to a metal backing 121 by means of an adhesive. The backing 121 has transverse
25 lines of perforation 122 at regular intervals. The continuous strip of service shut off device material can be cut off at a selected length by cutting through the intumescent material adjacent a transverse line of weakening 122 and then the backing 121 bent along a transverse line of weakening to break off the required length. The selected length of material can then be formed into a circular shape as
30 shown in Figure 16.

The backing 121 has between each line of weakening 122 a pair of raised portions 123 defining a slot 124 underneath it. Alternative portions between the transverse

lines of weakening have side flaps 125 which extend at least partially over the side of the intumescent material 120.

5 The circle of intumescent material formed as shown in Figure 16 can be joined across the join 127 by means of the bracket shown in Figure 17. The bracket 130 is fastened to the circle of fire collar strip so that the pins 131 extend into respective slots 124 across the join to provide a mounting bracket and to hold the strip in place. The bracket 130 includes a foot 133 with an aperture 134 so that the formed fire collar can be mounted to a surface.

10 Where a join in the continuous length of fire collar material is not necessary the bracket shown in Figure 18 may be used. This bracket 140 has two pins 141 spaced apart and adapted in use to extend into respective slots 124 in the continuous strip material.

It will be noted that the continuous strip material shown in Figure 22 can be used either way up as the slots are continuous under the raised portions 123.

15 Figure 19, 20, 21 and 23 show a still further embodiment of continuous strip material, a fire collar made from the continuous strip material and brackets to hold the fire collar.

20 The continuous strip material as shown in Figure 23 includes an intumescent material 150 with a metal backing 151 which has transverse lines of perforations 152 at regular intervals along its length. The continuous strip may be bent to form a required shape around a service line with bending occurring at the transverse lines of perforations 152 and the transverse lines of perforation also provide a region by which the strip material may be cut to a required length.

25 The continuous strip of material has a single row of raised portions 154 defining slots 155 underneath them. One raised portion is provided on each segment between transverse perforated lines 152.

30 As seen in Figure 19 a selected length of continuous material has been cut to fit around a cylindrical pipe and joined by fastening a bracket 160 across the join 161. Each bracket 160 has an upright portion 162 a foot 163 extending out from the upright portion and having an aperture 164 and an upper flange 165. On the

upright portion 162 there are a pair of pins 166. The pins are dimensioned and positioned to fit into adjacent slots 155. These adjacent slots 155 can be across a join such as the join 161 or adjacent slots at other portions around the periphery of the formed fire collar shown in Figure 19.

- 5 Any required number of brackets 160 may be used depending upon the size of the collar.

The intumescent material used with the various embodiments of service shut off device of the present invention may be of any convenient formulation which produces a material which has sufficient flexibility to be wound around into the
10 circular shape as required. It will be noted that the intumescent material in the flat strip is the same length as the casing but when the strip is formed into a circular service shut off device it must be shorter particularly on the inner edge.

In one form the intumescent material 28 as shown in Figure 4 may include a plurality of voids to make the material slightly spongy so that it can be easily bent and
15 easily reduce in length for the lesser internal diameter when formed into the circular shape. The intumescent material may have a backing material which is a non woven fibrous material to help it retain its strip form with the non woven fibrous material severed at intervals to provide lines of weakening for cutting of the new strip of casing and intumescent material to a required length.

20 Throughout this specification and the claims that follow unless the context requires otherwise, the words 'comprise' and 'include' and variations such as 'comprising' and 'including' will be understood to imply the inclusion of a stated integer or group of integers but not the exclusion of any other integer or group of integers.

CLAIMS

1. A service shut off device comprising a selected length of a composite body adapted to be formed into a shape to fit in use around a service line, the composite body having a flexible casing and a continuous body of intumescent material received in the casing, the composite body further comprising means associated with the casing to contain the intumescent material within the casing and means to retain the collar in a selected shape around the service line.
2. A service shut off device as in Claim 1 wherein the flexible casing is substantially U-shaped with the intumescent material received in the hollow of the U-shape.
3. A service shut off device as in Claim 1 wherein the flexible casing provides with a backing for the intumescent material, provides a backing and one edge or provides a backing and two edges.
4. A service shut off device as in Claim 1 wherein the flexible casing is made from a metallic material such as sheet aluminium, stainless steel or steel and is anodised or galvanised to prevent corrosion in an installation.
5. A service shut off device as in Claim 1 wherein the flexible casing is manufactured from a composite material such as a glass reinforced material or the like.
6. A service shut off device as in Claim 1 wherein the flexibility of the flexible casing is provided by a plurality of transverse lines of weakening in the casing and the intumescent material being sufficiently flexible to be able to be bent around the service line or pipe or containing areas of weakening to enable it to be bent into a selected shape such as a circular shape.
7. A service shut off device as in Claim 1 wherein the means to retain the collar in the selected shape such as a circular shape is a wire or other strap material which can be wound around the collar when it is formed into

the selected shape and joined to hold the collar in that shape.

8. A service shut off device as in Claim 1 wherein the means associated with the casing to contain the intumescent material within the casing is an adhesive.
- 5 9. A service shut off device as in Claim 1 wherein the means associated with the casing to contain the intumescent material within the casing includes a plurality of tabs associated with the casing which extend against or into the intumescent material.
- 10 10. A service shut off device as in Claim 1 wherein the body of intumescent material is continuous.
11. A service shut off device as in Claim 1 wherein the body of intumescent material may be transversely cut or perforated at intervals to assist with selection of the required length of the service shut off device.
- 15 12. A service shut off device as in Claim 1 wherein the means to retain the collar in the selected shape includes a link member, the link member having a plurality of pins adapted to co-act with apertures on the casing across a join in the casing whereby the collar is retained in the selected shape.
- 20 13. A service shut off device as in Claim 1 wherein the service shut off device is adapted to be formed around a service line within a wall or soffit.
14. A service shut off device as in Claim 1 wherein the service shut off device is adapted to be mounted against a wall or soffit.
- 25 15. A service shut off device as in Claim 1 further including at least one bracket either associated with the casing or being a separate bracket which can be fastened onto the casing to hold the casing against a wall or soffit.
16. A service shut off device as in Claim 15 including a plurality of co-acting

connecting pieces on the bracket and the casing so that the bracket is retained onto the casing.

- 5 17. A service shut off device as in Claim 16 wherein the co-acting connecting piece between the casing and the bracket may also act to be a connector between the ends of the casing of the composite body to both retain the casing in the selected shape and to be used as a bracket.
18. A fire collar comprising a stack of two or more service shut off devices as defined in any one of claims 1 to 17.
- 10 19. A continuous strip of fire collar material including a casing and a continuous flexible intumescent material within the casing, the strip comprising the casing and intumescent material adapted to be severed at a selected length along the length of the continuous strip whereby the strip can be severed at the selected length and the severed portion wrapped around a service line such as a pipe or cable tray to provide a fire collar.
- 15 20. A continuous strip of fire collar material as in Claim 19 having transverse lines of weakening at regular positions along the length of the casing such that the casing is flexible and may be bent around a service line or cable tray.
- 20 21. A continuous strip fire collar material as in Claim 20 wherein the transverse points of weakening are provided by a plurality of lines of perforations transverse to the length of the strip, or alternatively are provided by thinning of the material in transverse lines across the strip material.
- 25 22. A continuous strip fire collar material as in Claim 20 wherein the transverse lines of weakening also provide the regions at which the strip of material can be severed to form the individual lengths for the fire collar and also enable it to be bent around or wrapped around to form a selected shape for the fire collar.
- 30 23. A continuous strip fire collar material as in Claim 20 wherein the body of intumescent material is continuous.

24. A continuous strip fire collar material as in Claim 20 wherein the body of intumescent material may be transversely cut or perforated at intervals to assist with selection of the required length of the continuous strip of fire collar material.
- 5 25. A continuous strip fire collar material as in Claim 20 further including means associated with the casing to contain the intumescent material within the casing which means is an adhesive.
- 10 26. A continuous strip fire collar material as in Claim 19 wherein the casing includes lugs formed or bent out of the plane of the casing to extend against or into the intumescent material within the casing to retain the intumescent material in the casing.
- 15 27. A continuous strip fire collar material as in Claim 19 wherein the casing is comprised of a face section and two side sections adapted in use to provide a substantially U-shaped body and lugs bent out of the casing to extend against or into the intumescent material within the casing to retain the intumescent material in the casing are provided on the face of the casing or on one of the side sections.
- 20 28. A continuous strip fire collar material as in Claim 19 wherein the casing is comprised of a backing for the intumescent material or a backing and one edge.
- 25 29. A continuous strip fire collar material as in Claim 17 wherein the casing is comprised of the side sections are formed from a plurality of tabs configured such that upon bending of the continuous strip into a selected shape such as a circular shape the tabs enable the inner side of the strip to form a smaller radius than the outer side and the tabs overlap or pass under adjacent tabs to enable the bending.
- 30 30. A continuous strip fire collar material as in Claim 25 including on the casing two bend lines between the face section and each side section with the lines separated by essentially the thickness of the casing material and alternate tabs bent on one of the lines and the in between tabs bent on the other of the lines.

31. A continuous strip fire collar material as in Claim 29 including a bend line for each tab angled to the direction of elongation of the strip so that during bending a tab passes under the adjacent tab on one side and over the adjacent tab on its other side.
- 5 32. A continuous strip fire collar material as in Claim 29 further including from one or both of the side sections tongues extending from the side sections and which are folded over the intumescent material such that they are substantially parallel to the face of the casing, with one tongue extending from each tab on each side.
- 10 33. A continuous strip fire collar material as in as in Claim 19 further including brackets to mount the fire collar to a wall or ceiling or soffit in use.
34. A continuous strip fire collar material as in Claim 33 wherein the brackets are adapted to clip onto the casing so that they are retained with the casing.
- 15 35. A continuous strip fire collar material as in Claim 33 including a plurality of co-acting connecting portions on the brackets and collar so that the bracket can be retained onto the continuous strip.
- 20 36. A continuous strip fire collar material as in Claim 35 wherein the co-acting connecting arrangement includes a plurality of slots formed in the casing with a plurality of pins on the brackets or alternatively the pins are provided on the casing and the slots on the brackets.
37. A continuous strip fire collar material as in Claim 19 further including means to retain the continuous strip of material into a selected shape such as a circular shape.
- 25 38. A continuous strip fire collar material as in Claim 37 wherein the means to retain the continuous strip of material comprises wire or other strip material adapted to be wrapped around the casing and joined together to form the selected shape of the fire collar.
39. A continuous strip fire collar material as in Claim 37 wherein the means to

retain the continuous strip of material comprises co-acting connecting portions on both ends of the strip when wrapped in the selected shape and on a bracket so that the bracket acts as both the mounting bracket and retainer for the selected shape.

- 5 40. A service shut off device formed from the continuous strip fire collar material as defined in any one of claims 19 to 39.
41. A service shut off device comprising a stack of fire collars formed from the continuous strip fire collar material as defined in any one of claims 17 to 35.
- 10 42. A service shut off device comprising a stack of two or more fire collars.
43. An intumescent material for a service shut off device, the intumescent material including a plurality of voids such that a strip of the material can be formed into substantially circular shape with the material being compressed and absorbing the compression by means of the voids to
- 15 allow for an inner circumference which is smaller than an outer circumference.
44. An intumescent material for a service shut off device as in claim 43 wherein the intumescent material has a backing material which is a non-woven fibrous material.
- 20 45. An intumescent material for a service shut off device as in claim 43 wherein the non-woven fibrous material is severed transversely at intervals to provide lines of weakening for cutting of the strip to a required length.
- 25 46. An intumescent material for a service shut off device as in claim 43 wherein the intumescent material is mounted to a elongate sheet of metal.
47. An intumescent material for a service shut off device as in claim 43 wherein the sheet of metal is perforated.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/AU 00/00407

A. CLASSIFICATION OF SUBJECT MATTER																						
Int Cl ⁷ : F16L 57/04, 57/00, 5/04																						
According to International Patent Classification (IPC) or to both national classification and IPC																						
B. FIELDS SEARCHED																						
Minimum documentation searched (classification system followed by classification symbols)																						
IPC: F16L 57/04, 57/00, 5/04																						
Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched																						
AU : IPC as above																						
Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)																						
IPC as above and pipe and intumescent and fire + collar + F16L/ic and fire + and collar +																						
C. DOCUMENTS CONSIDERED TO BE RELEVANT																						
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

INTERNATIONAL SEARCH REPORT

International Application No.

PCT/AU 00/00407

Box I Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a)

Box II Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows: Claims 1, 19, 43 and those claims appended thereto basically define an intumescent material which may be used as a wrap around fire collars. Claim 42 however merely defines a shut off device comprising two or more fire collars.

1. ☒ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT
Information on patent family members

International application No.
PCT/AU 00/00407

This Annex lists the known "A" publication level patent family members relating to the patent documents cited in the above-mentioned international search report. The Australian Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
